Water Management Challenges in Global Change B. Ulanicki 2020-11-25 Water Management Challenges in Global Change contains the proceedings of the 9th Computing and Control for the Water Industry (CCWI2007) and the Sustainable Urban Water Management (SUWM2007) conferences. The rationale behind these conferences is to improve the management of urban water systems through the development of computerbased methods. Issues such as economic globalisation, climate changes and water shortages call for a new approach to water systems management, which addresses the relevant technical, social and economic aspects. This collection represents the views of academic and industrial experts from a number of countries, who provide technical solutions to current water management problems and present a vision for addressing the global questions. The themes underlying many of the contributions include energy and material savings, water savings and the integration of different aspects of water management. The papers are grouped into three themes covering water distribution systems, sustainable urban water management and modelling of wastewater treatment plants. The water distribution topics

cover asset and information management, planning, monitoring and control, hydraulic modelling of steady state and transients, water quality and treatment, demand and leakage management, optimisation, design and decision support systems, as well as reliability and security of water distribution systems. The sustainable urban water management topics include urban drainage systems, water reuse, social aspects of water management and also selected facets of water resources and irrigation. Computer control of wastewater treatment plants has been seen as less advanced than that of clean water systems. To address this imbalance, this book presents a number of modelling techniques developed specifically for these plants. Water Management Challenges in Global Change will prove to be invaluable to water and environmental engineering researchers and academics; managers, engineers and planners; and postgraduate students. Cross Country Pipeline Risk Assessments and Mitigation Strategies Arafat Aloqaily 2018-07-12 Cross Country Pipeline Risk Assessments and Mitigation Strategies describes the process of pipeline risk management and hazard identification, using qualitative risk assessment, consequence modeling/evaluation, pipeline failure rates, and risk calculations, as well as risk mitigation and control strategies. The book evaluates potential causes of pipeline failure in the oil and gas industry based on a wide range of data that cover more than 40 years of operating history. Additionally, it details a consistent approach that allows for proper estimation of potential risk and offers methods for mitigating this potential risk. This approach is then combined with consequence modeling to fully

calculate the different forms of risk presented by pipelines. Cross Country Pipeline Risk Assessments and Mitigation Strategies is an essential resource for professionals and experts involved in pipeline design as well as researchers and students studying risk assessment, particularly in relation to pipelines. Offers a practical risk assessment model for pipelines without the need for complicated, expensive software. Describes a new and systematic approach for pipeline risk control and mitigation that reflects actual pipeline conditions and operating status. Provides examples of all pipeline hazard identification techniques and how they are used to produce consistent results. Includes access to a newly developed Excel tool PipeFAIT for assessing pipeline risk.

Pipeline Risk Management Manual W. Kent Muhlbauer 1996 Where is the greatest potential for failure in pipeline operations? What portion of the pipeline budget should be spent on maintenance? Will more surveillance or more safety devices substantially reduce pipeline risk exposure? This indispensable book answers these questions and many more like them. Pipeline Risk Management Manual provides pipeline professionals with a practical risk-management tool that does not require huge databases, complicated calculations, or detailed probabilistic theories. A unique indexing system provides a step-by-step procedure for analyzing cross-country pipeline facilities. It incorporates factors that contribute to or reduce pipeline failures such as third party activity levels, design criteria, corrosion potential and control, human error, and the consequences of failure. Pipeline professionals can use these factors to compare relative risks and to make decisions using a quantifiable, objective system of analysis. Historical data, work experience, and even an element of common sense can also be factored into this versatile, flexible risk assessment tool. As a result, this revolutionary new approach will become a vital part of your everyday design, business, and operations decisions.
